

Active Directory Certificate Services Exploitation

LuxCamp 2024 Edition 

10.08.2024, LuxCamp 2024 der LuXeria, Brütisellen
Emanuel Duss <emanuel.duss@compass-security.com>

Agenda

- Active Directory Introduction
- Active Directory Information Gathering
- AD Certificate Services Introduction
- AD Certificate Services for Attackers
- AD Certificate Services Example Attack
- Live Demo

Slides:

<https://github.com/luxeria/slides/tree/master/LuxCamp2024>

Active Directory Introduction

Active Directory

- Active Directory (AD) is a directory service (database) developed by Microsoft
- Used for centralized management of the IT infrastructure
- Relies heavily on DNS, LDAP, NTLM, Kerberos (Microsoft's version) and SMB
- Structured in objects
 - Resources (e.g. file shares, printers)
 - Accounts / Security Principals (e.g. users, groups, computers, servers)
- A collection of objects is called a domain, stored on the Domain Controller (DC)
 - Domains identified by DNS name (e.g. example.net, foobar.local)

Active Directory for Attackers

- The AD is interesting for attackers, because if this is compromised, nearly everything is compromised.
- AD infrastructure can be very complex
 - There are common misconfigurations and pitfalls that can be abused by attackers
- Common Mistakes
 - All computers have the same local admin password
 - Least privilege principle is often not applied
 - Accounts with too much privileges used
 - Sensitive information on shares a user can access
 - Product specific attacks (WSUS, SCCM, AD CS, ...)
 - Protocol specific attacks (DNS, LDAP, SMB, RPC, Kerberos, NTLM, ...)
- Today, we will focus on Active Directory Certificate Services (AD CS)

AD Information Gathering

PingCastle

- «Get Active Directory Security at 80% in 20% of the time.»
- «Ping Castle is a tool designed to **assess quickly the Active Directory security** level with a methodology based on risk assessment and a maturity framework. It does not aim at a perfect evaluation but rather as an **efficiency compromise.**»
- Main features:
 - Healthcheck of the domain
 - Cartography of domain trusts
 - Scanner for various settings (LAPS, local admins, shares, SMB protocol settings, print spooler)
- Requires access to the domain as a low-privileged user via DNS, LDAP and SMB
- Open source and free to use for non-commercial purposes.
- Very easy to use. Vulnerabilities and recommendations are included.
- Web: <https://www.pingcastle.com>, <https://github.com/vletoux/pingcastle>

Example Report

test.mysmartlogon.com

2020-01-18

About

test.mysmartlogon.com - Healthcheck analysis

Date: 2020-01-18 - Engine version: 2.8.0.0

This report has been generated with the Basic Edition of PingCastle.
Being part of a commercial package is forbidden (selling the information contained in the report).
If you are an auditor, you MUST purchase an Auditor license to share the development effort.

Active Directory Indicators

This section focuses on the core security indicators.
Locate the sub-process determining the score and fix some rules in that area to get a score improvement.

Indicators

Domain Risk Level: 100 / 100

It is the maximum score of the 4 indicators and one score cannot be higher than 100

Stale Object : 80 /100

It is about operations related to user or computer objects

6 rules matched

Privileged Accounts : 100 /100

It is about administrators of the Active Directory

14 rules matched

Trusts : 100 /100

It is about links between two Active Directories

Anomalies : 100 /100

It is about specific security control points

16 rules matched

Risk model

Stale Objects	Privileged accounts	Trusts	Anomalies
Inactive user or computer	Account take over	Old trust protocol	Audit
Network topography	ACL Check	SID Filtering	Backup
Object configuration	Admin control	SIDHistory	Certificate take over
Obsolete OS	Irreversible change	Trust impermeability	Golden ticket
Old authentication protocols	Privilege control	Trust inactive	Local group vulnerability
Provisioning			Network sniffing
Replication			Pass-the-credential
Vulnerability management			Password retrieval
			Reconnaissance
			Temporary admins
			Weak password

Active Directory Certificate Services

Authentication in Active Directory

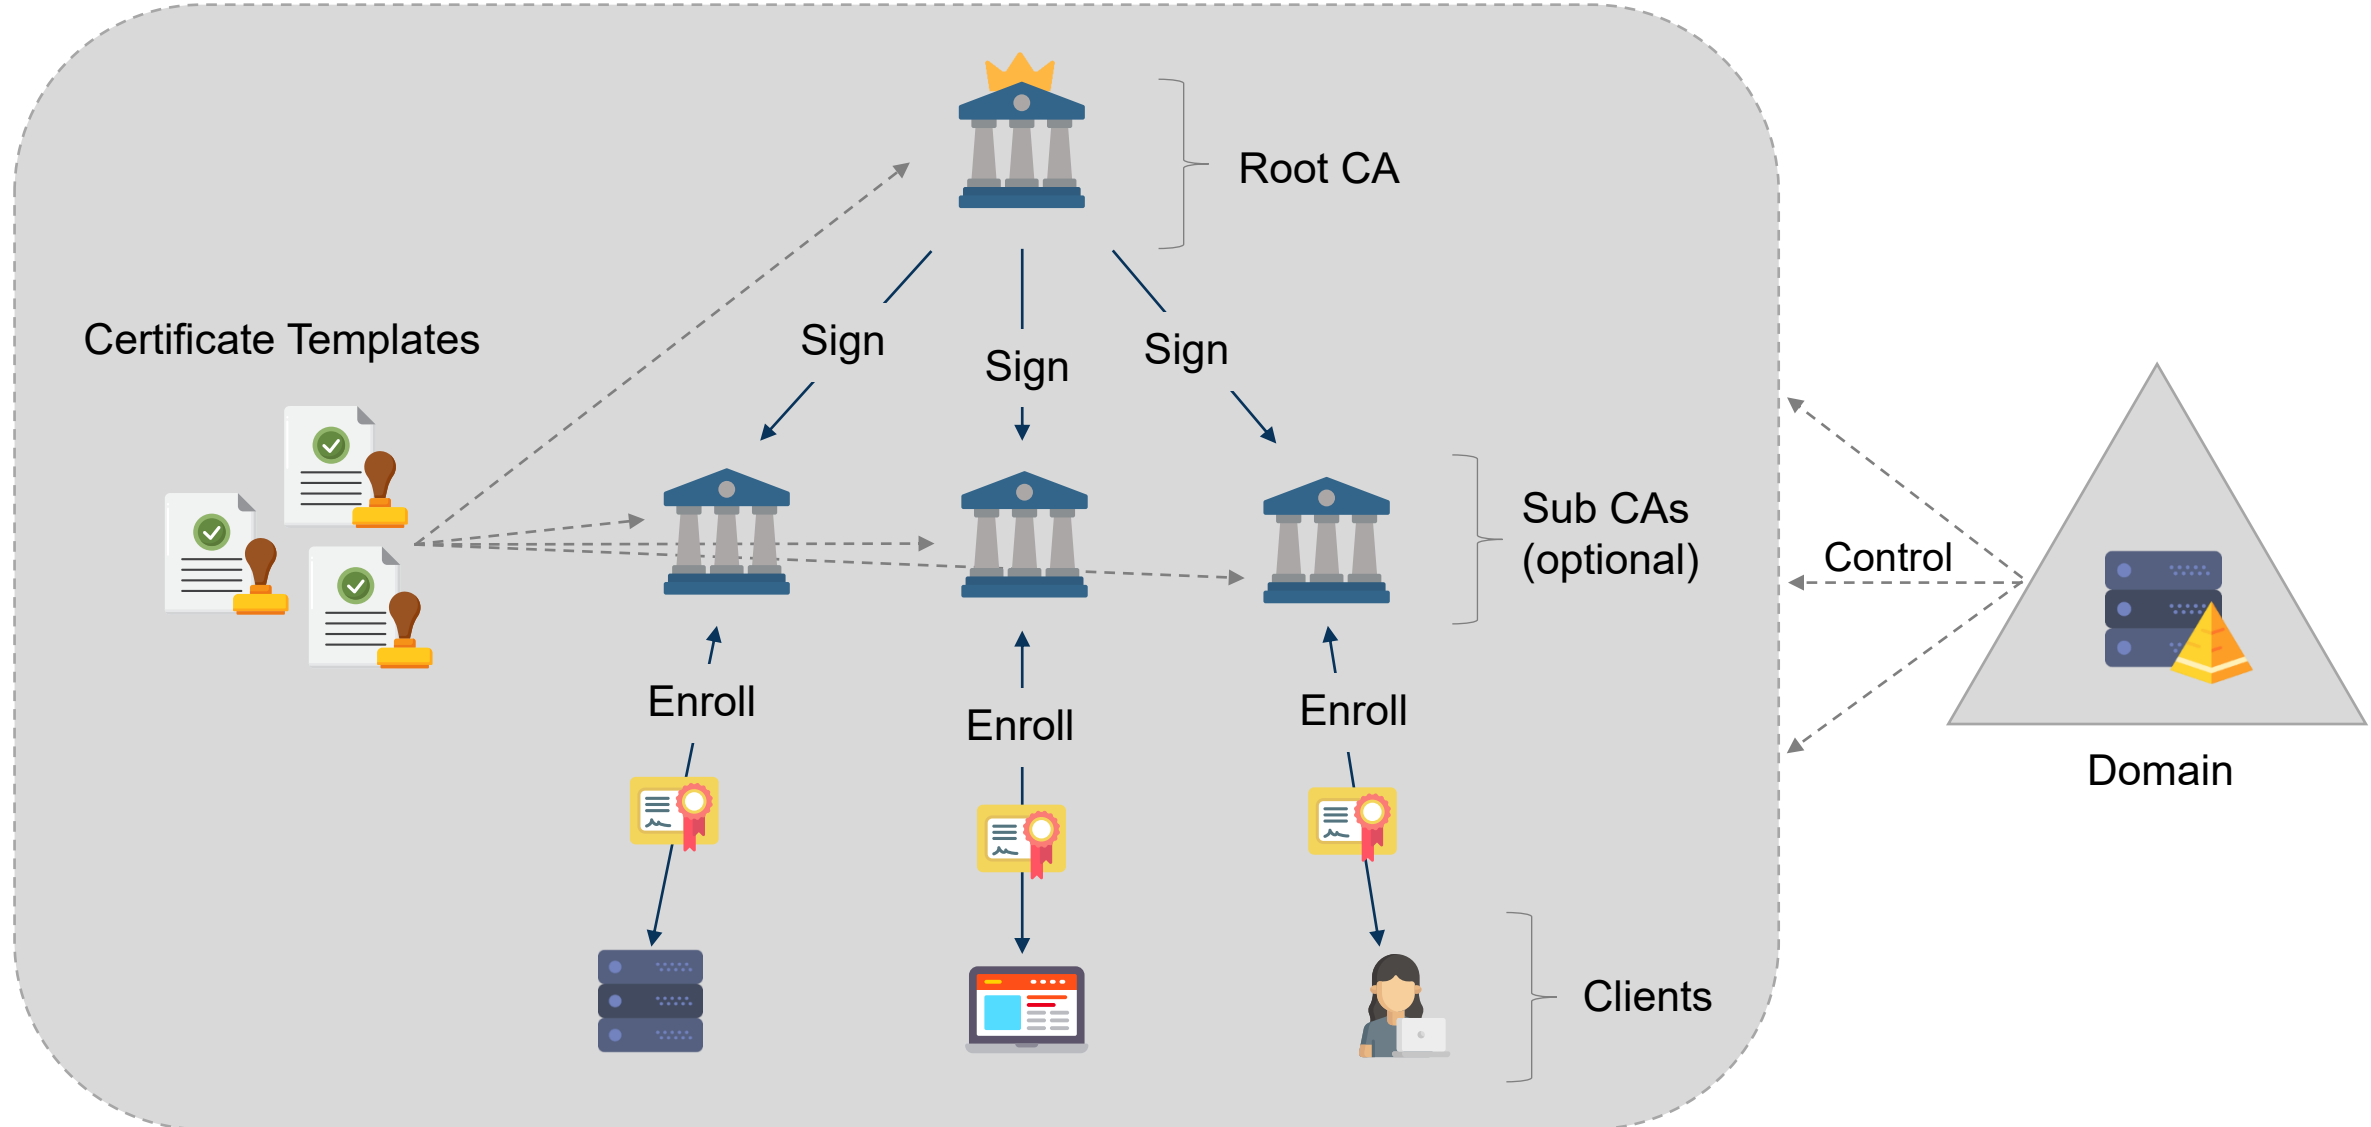

- Authentication in AD is mostly done using the NTLM or Kerberos protocol
- NTLM uses a challenge-response protocol
 - To authenticate, a challenge from the server is encrypted using a key derived from the password
- Kerberos uses symmetric cryptography and a central key server (KDC)
 - To authenticate, a timestamp is encrypted using a key derived from the password
- The Kerberos PKINIT extension allows authentication based on certificates
 - To authenticate, a timestamp is signed using a the certificate's private key
 - Typically used for smart card logins
 - The client get's a ticket which can be used further
- For certificate authentication, the issuing certificate authority (CA) must be trusted by KDC
- For this, a public key infrastructure (PKI) is needed.

AD CS Introduction

- Active Directory Certificate Services (AD CS) is a CA provided by Microsoft to build a PKI
- Heavily integrated into Active Directory
- It manages certificates and private/public keys for various purposes:
 - S/MIME
 - VPN/IPSec
 - Smartcard logins
 - SSL/TLS
 - Digital signatures
 - **Client authentication**
 - Etc.
- AD CS can be assigned as a role to a server within the AD
- Based on certificate templates to allow specific users to enroll for specific purposes

AD CS Building Blocks

Common Terms

- **PKI** (Public Key Infrastructure) - a system to manage certificates/public key encryption
- **AD CS** (Active Directory Certificate Services) - Microsoft's PKI implementation
- **CA** (Certificate Authority) - PKI server that issues certificates
- **Enterprise CA** - CA integrated with AD (as opposed to a standalone CA), offers certificate templates
- **Certificate Template** - a collection of settings and policies that defines the contents of a certificate issued by an enterprise CA
- **SAN** - Subject Alternative Name, additional entity/subject bound to the certificate

Information Gathering & Interaction

- Both Windows onboard tools and third-party party software available
- Windows Tools:
 - Certutil.exe
 - Certificate manager (certmgr.msc)
- Third-Party Tools:
 - PingCastle: <https://pingcastle.com/>
 - Certify: <https://github.com/GhostPack/Certify>
 - Certipy: <https://github.com/ly4k/Certipy>
 - BloodHound: <https://github.com/SpecterOps/BloodHound>

AD CS for Attackers

AD CS for Attackers

- AD CS can become highly complex quickly which may result in various security issues
- Possible consequences when abused by attackers:
 - Credential theft
 - Account persistence
 - Domain escalation
 - Domain persistence
- Researchers have identified various widespread misconfigurations
 - <https://posts.specterops.io/certified-pre-owned-d95910965cd2>
 - Typical issues used for privilege escalation are named ESC1 - ESC14

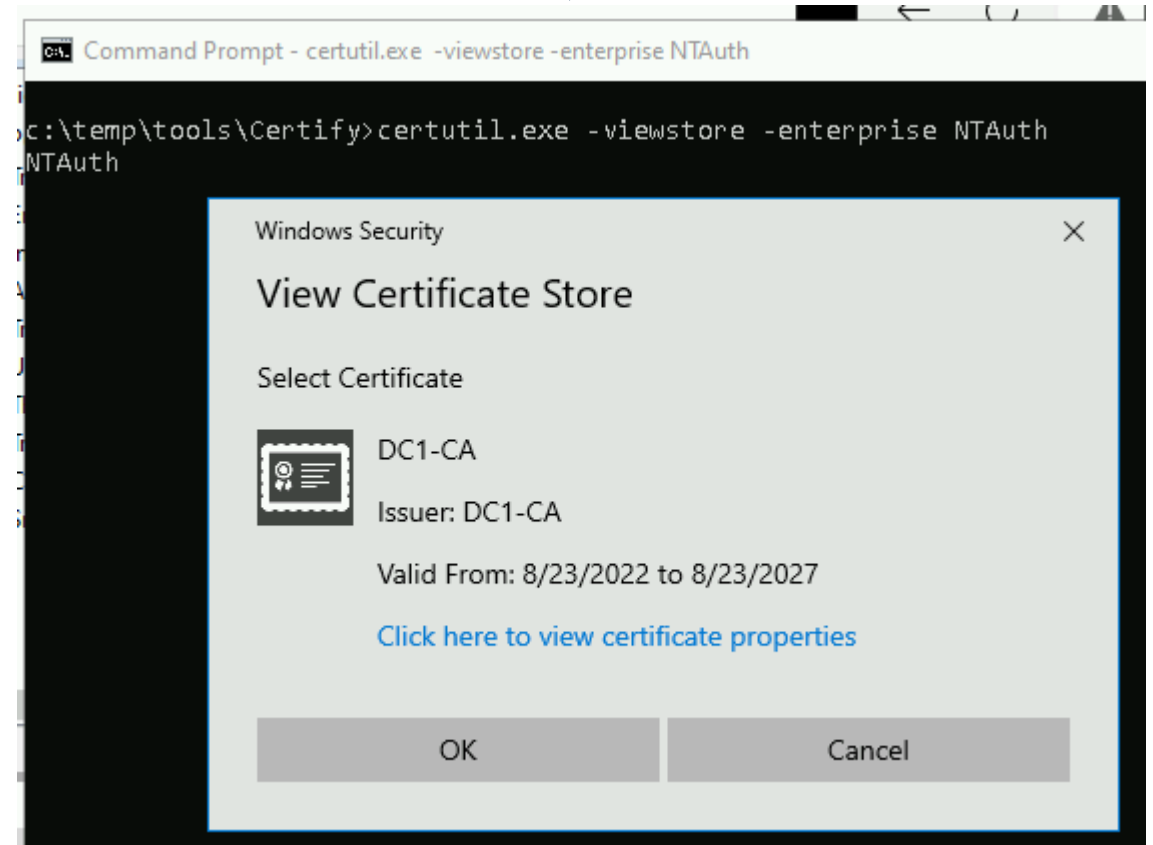

AD CS for Attackers (cont.)

- Main focus lies on certificate templates that enable **authentication to the AD**
- Attackers may try to get certificates for:
 - accounts they control (persistence)
 - other users (persistence & privilege escalation)
- Certificates can also be combined with other "hacking" tools (for Pass-the-Certificate)
- Authentication will work until the certificate is revoked → changing the password has no effect

Authentication via Certificates

Multiple conditions must be fulfilled to enable authentication with a certificate

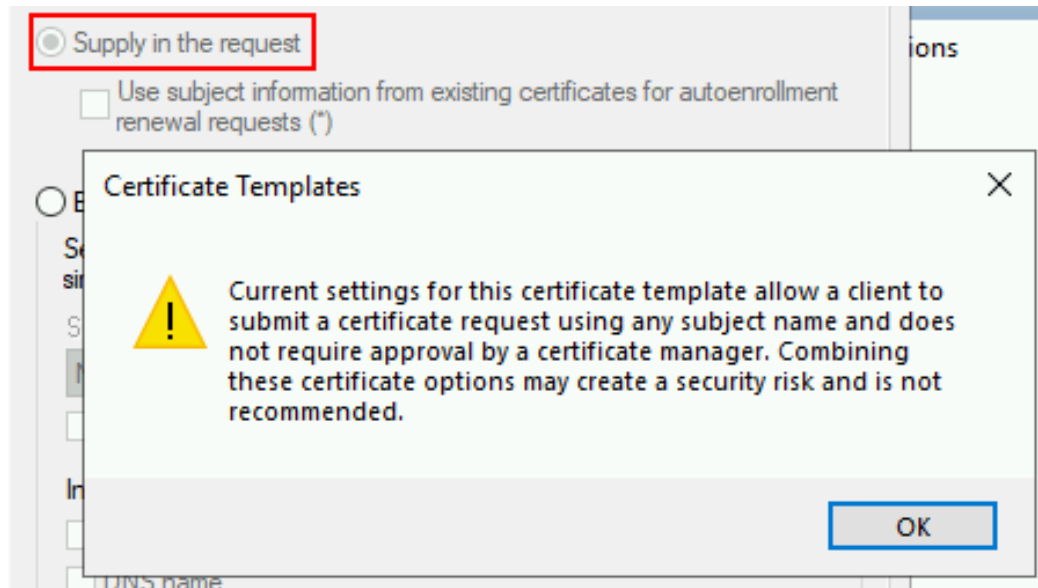

- The issuing CA must be part of the domain's NT Auth Store
- The Extended Key Usage (EKU) of the certificate must be one of:
 - Client Authentication
 - PKINIT Client Authentication
 - Smart Card Logon
 - Any Purpose
 - SubCA

Example Attack ESC1

ESC1 – User-Defined Subject Alternative Name

- Templates can be configured to allow a **user-defined Subject Alternative Name (SAN)**
- The SAN is used to specify additional subjects this certificate represents
- The certificate can be used to authenticate as any listed subject
- A user-defined SAN therefore allows requesting certificates for **any user!**
- Up-to-date AD CS servers will warn you about this:

ESC1

- Preconditions:

- Manager approval is disabled
- No authorized signatures are required
- The template allows low-privileged users to enroll
- The template defines EKU that can be used for authentication
- The template allows requesters to specify a subject alternative name (SAN)
- The issuing CA must be part of the domain's NT Auth Store

- Consequences:

- Low privileged users can request certificates which include other identities and allow authentication
- This allows attackers to impersonate any other domain user against the Active Directory

PingCastle Analysis

Certificate Templates

This section lists certificate templates which can be used to generate a certificate. A misconfiguration can allow an attacker to create its own certificate and use it to impersonate other u

Number of certificate templates: 18

Certificate Templates				
Name ▲	Destination ▼	Enrollee can supply subject ? ▼	Everyone can enroll ? ▼	For Authentication ? ▼

```
[ CUT ]
```

Example Attack ESC6

ESC6 – User-Defined SAN on CA Level

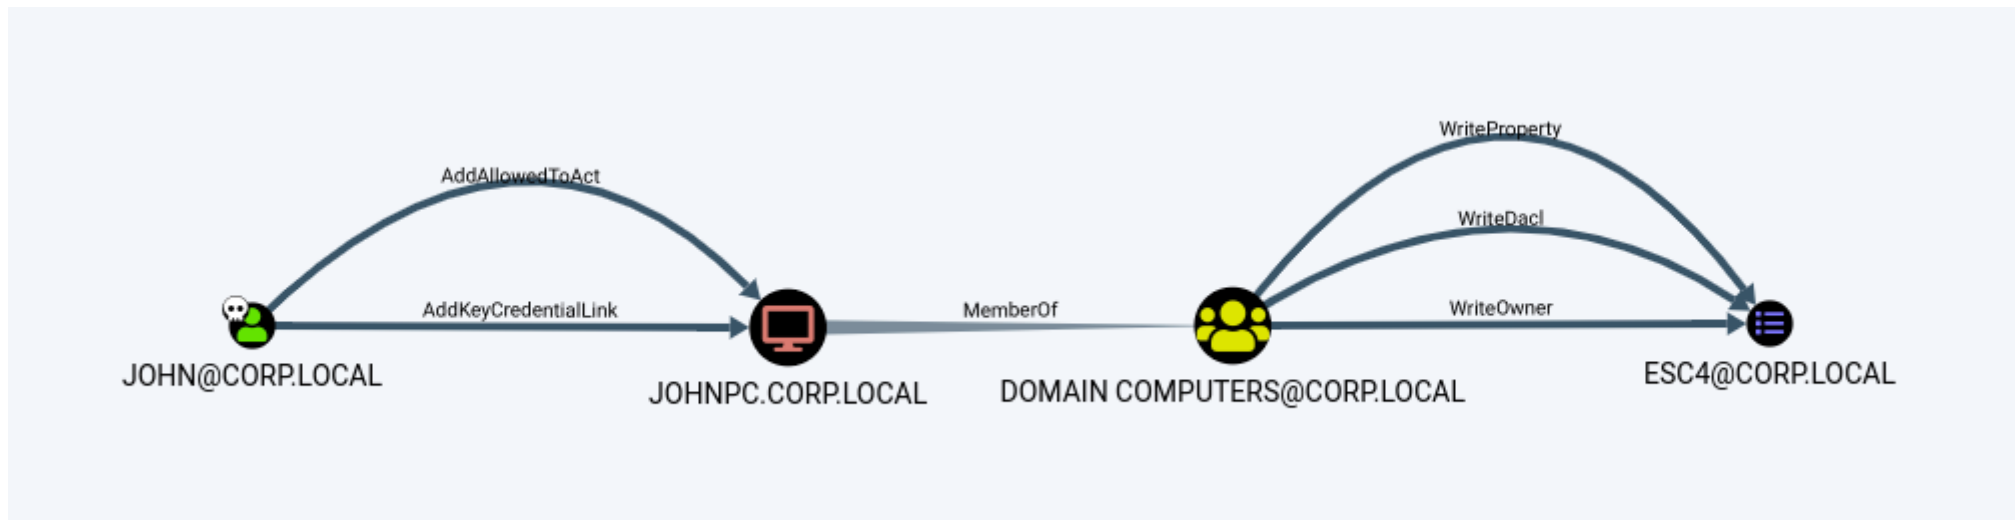

- In ESC1, specifying an additional subject (SAN) was configured on **certificate template level**
- The same is also possible on the **CA level**
- The flag **EDITF_ATTRIBUTESUBJECTALTNAME2** (configured on CA level) allows specifying arbitrary SANs on ANY template of the CA!
- If there are templates that allow low-privileged users to enroll and that can be used for domain authentication, attackers can abuse these for impersonation

→ Abuse is broken by May 2022 security update to address a different vulnerability

Example Attack ESC4

ESC4

- Certificate templates are objects within the Active Directory
- Access to them can be controlled via security descriptors on these objects (ACLs)
- If certificate templates can be edited by low-privileged users, attackers may misconfigure them on purpose (e.g. cause ESC1-ESC3)

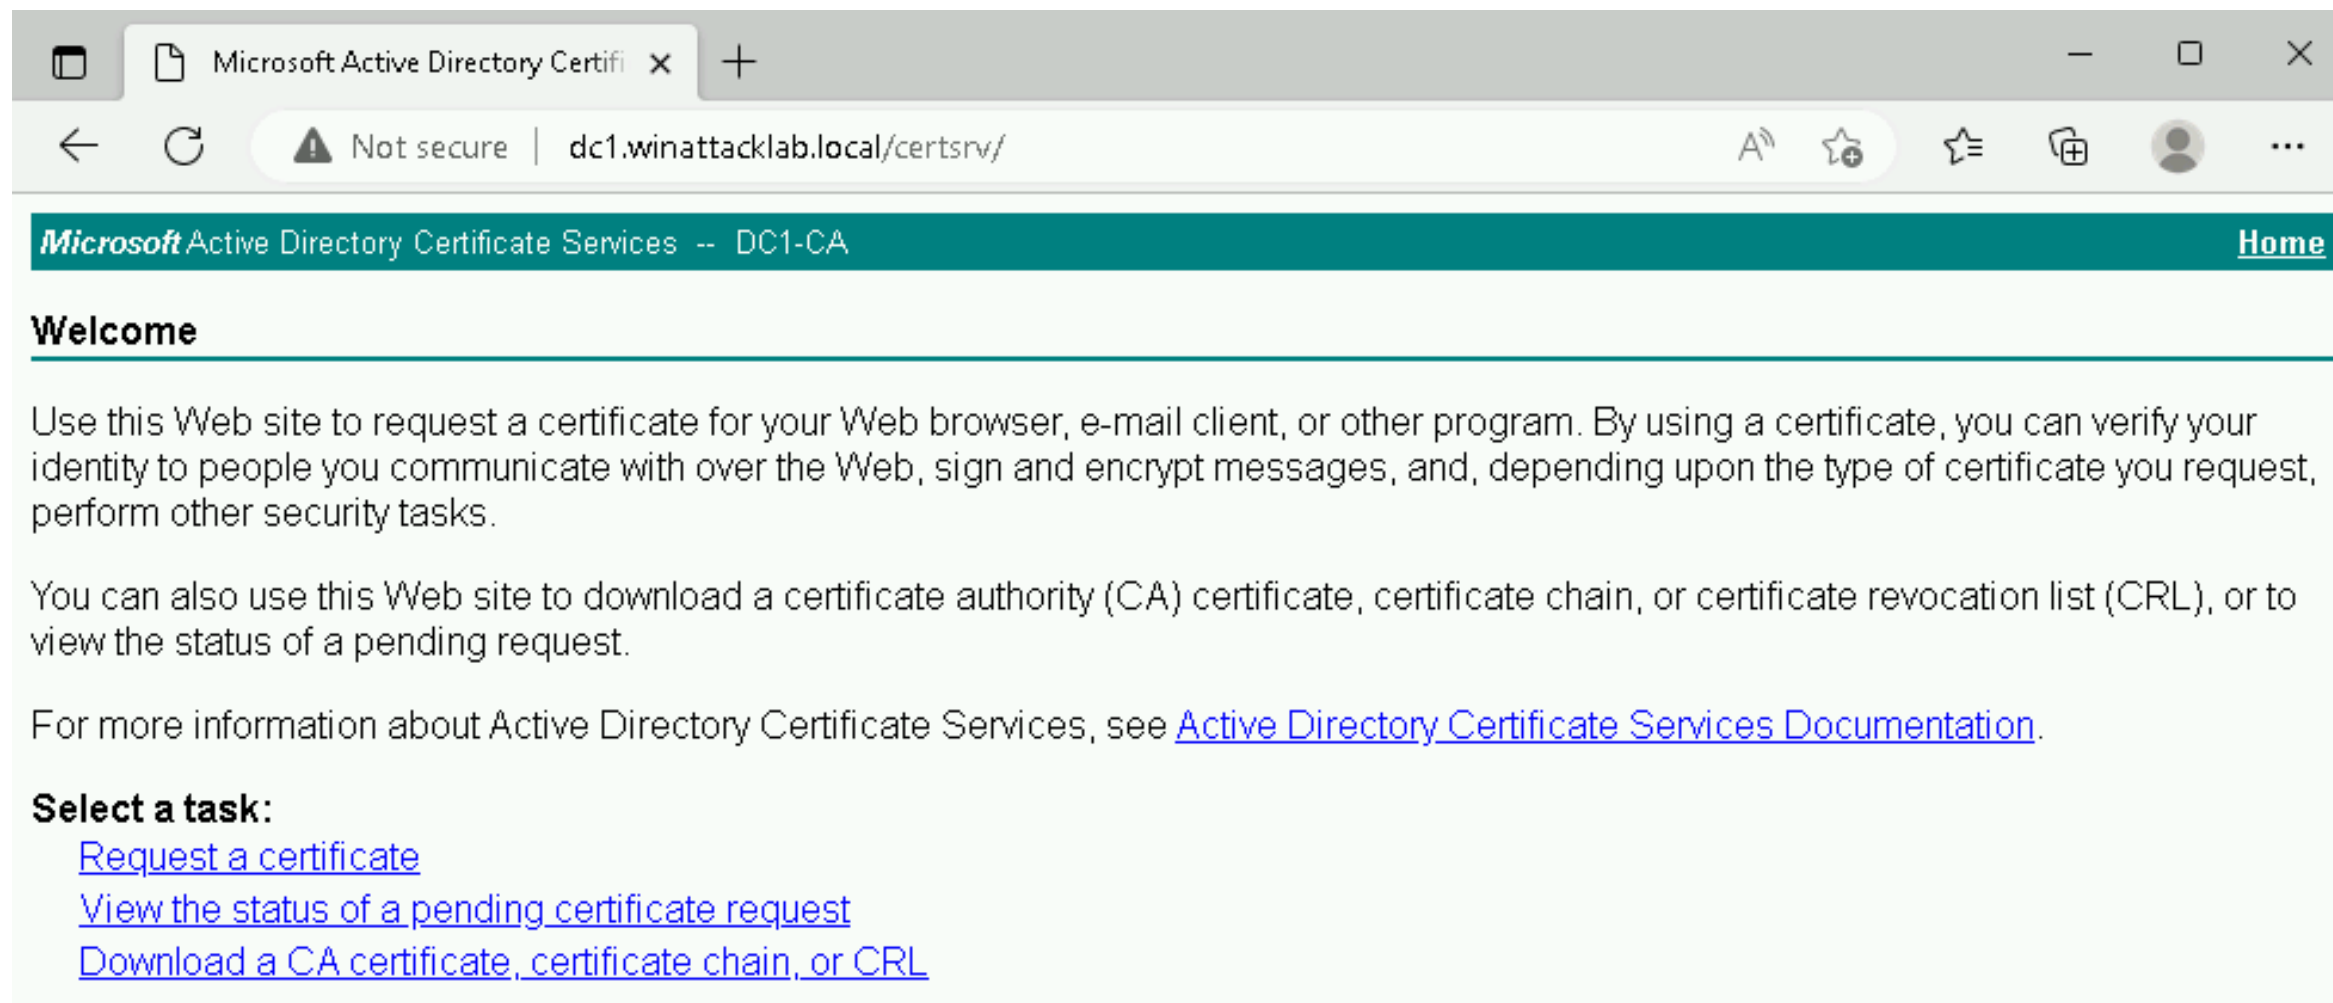

Source: <https://book.hacktricks.xyz/windows-hardening/active-directory-methodology/ad-certificates/domain-escalation>

- ESC5 and ESC7 are similar (access control issues on AD objects)

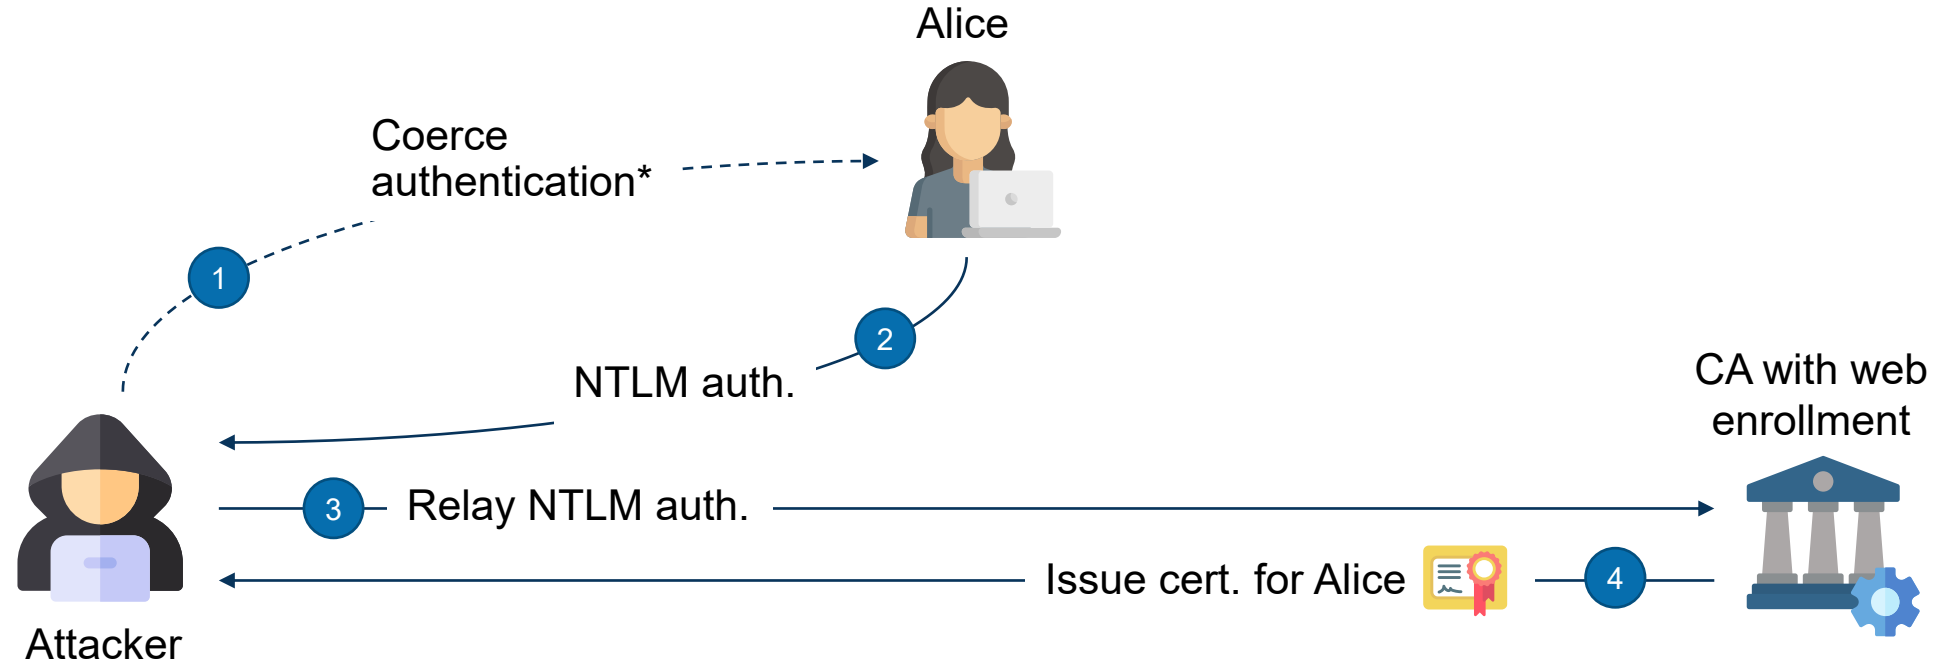

Example Attack ESC8

ESC8 – Web Enrollment Example

Web enrollment website:

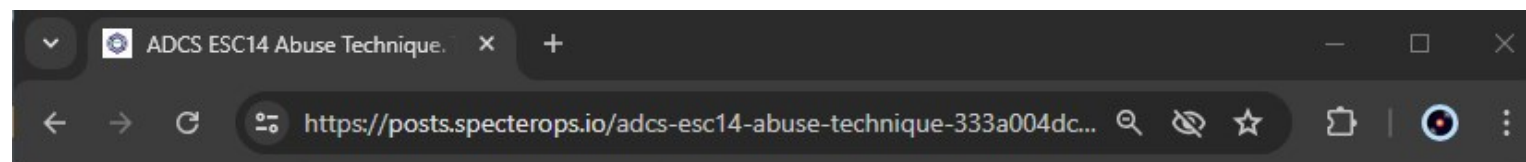

ESC8 – Attack Overview

Example Attack ESC14

ESC14

The next sections will outline the specific requirements for each of the ESC14 A-D scenarios. Here is an overview:

File type	Access Subject	No reqs	computer	No reqs	DNS	File type	TLS	No reqs	FAL32	No reqs	File type	FAL32	No reqs	File type	FAL32	073	File type	No reqs	ES14-C	-

[illegible]

<https://posts.specterops.io/adcs-esc14-abuse-technique-333a004dc2b9>

Summary

Summary

- Active Directory security is hard
- Configuring the different services (like AD CS) securely is hard
- Good know-how is required to understand the consequences of settings
- Small misconfigurations can lead to serious issues (privilege escalation)
- Simple tools can help you to analyze the AD
- Try it in your infrastructure (of course, only if you have the permission 😊)
